

STORAGE CONTAINERS

The storage of raw materials, semi-finished products, finished products or hazardous substances is a major problem for many companies; usually the storage of these products takes place outside as the spaces available within companies are often limited.

Using a container allows you to solve these problems by storing the products in complete safety.

Even in case of temporary storage of waste our containers allow the incompatible waste to be stored in order to not be able to come into contact.

The three types of containers proposed by Airbank are:

- Steel containers for simple storage requirements
- Containers with insulated polyurethane panels for all those requirements of thermal insulation of substances
- Container with insulated REI / EI panels where the thermal insulation must also be combined with the fire resistance of the container.

Our containers are lockable, they allow to separate incompatible substances, they are provided with ventilation grids and in case of storage of liquids, containment basins as prescribed by the Italian law of 18/05/1995.

The containers can be made open space or with pallet/cantilever shelf unit.

If there is no need for a containment basin because the substances, products or waste are not liquids, containers with linoleum floors are also available, or steel floors when a higher flow rate is required.

These containers can be used as warehouses and can be equipped with options such as air conditioning systems, fire protection systems, electrical and lighting systems as well as windows to ensure natural lighting.
