

CONTAINER FOR STORAGE OF HAZARDOUS SUBSTANCES

Dangerous substances storage is a major issue for many companies; usually their stocking is done outside because the spaces within the companies are often limited. Adopting a container as a storage system allows to store in complete safety the various chemical substances ensuring an optimal storage.

Our containers can be equipped with a key lock, allowing separation of incompatible substances and have ventilation grids and containment basins made as per prescribed requirements of M.D. of 18/05/1995.

Even in case of temporary waste storage our containers allow incompatible waste to be stored without coming in contact. Additionally "if the storage of liquid waste is done in a tank above ground, this must be equipped with a containment basin with a capacity equal to the entire volume of the tank (or container in general-ed). If in one plant there are more tanks (or containers - ed), only one containment basin, with a capacity equal to the third part of the actual total tanks capacity, could be realized. In any case, the basin must have a capacity equal to that of the largest tank. Even in this case, our containers ensure compliance with the requirements of the regulations in force.

Steel containers for simple storage requirements.

Containers with insulated panels REI/ EI where thermal insulation must be combined with fire resistance.

Containers with insulated polyurethane panels for substances needing thermal insulation.
